respectively we parametrize the solutions by the first two and
fourth expressions in Solutions 1 and 2 in a neighborhood of any
point  $(W_1, t, W_2)$  such that the expression in the square root and

Not agree (this means we consider all 4 pairs we describe above).
We conclude that NO component of the solution set of the first

Analogously, NO component of the solution set of the other pair

Out[205]=

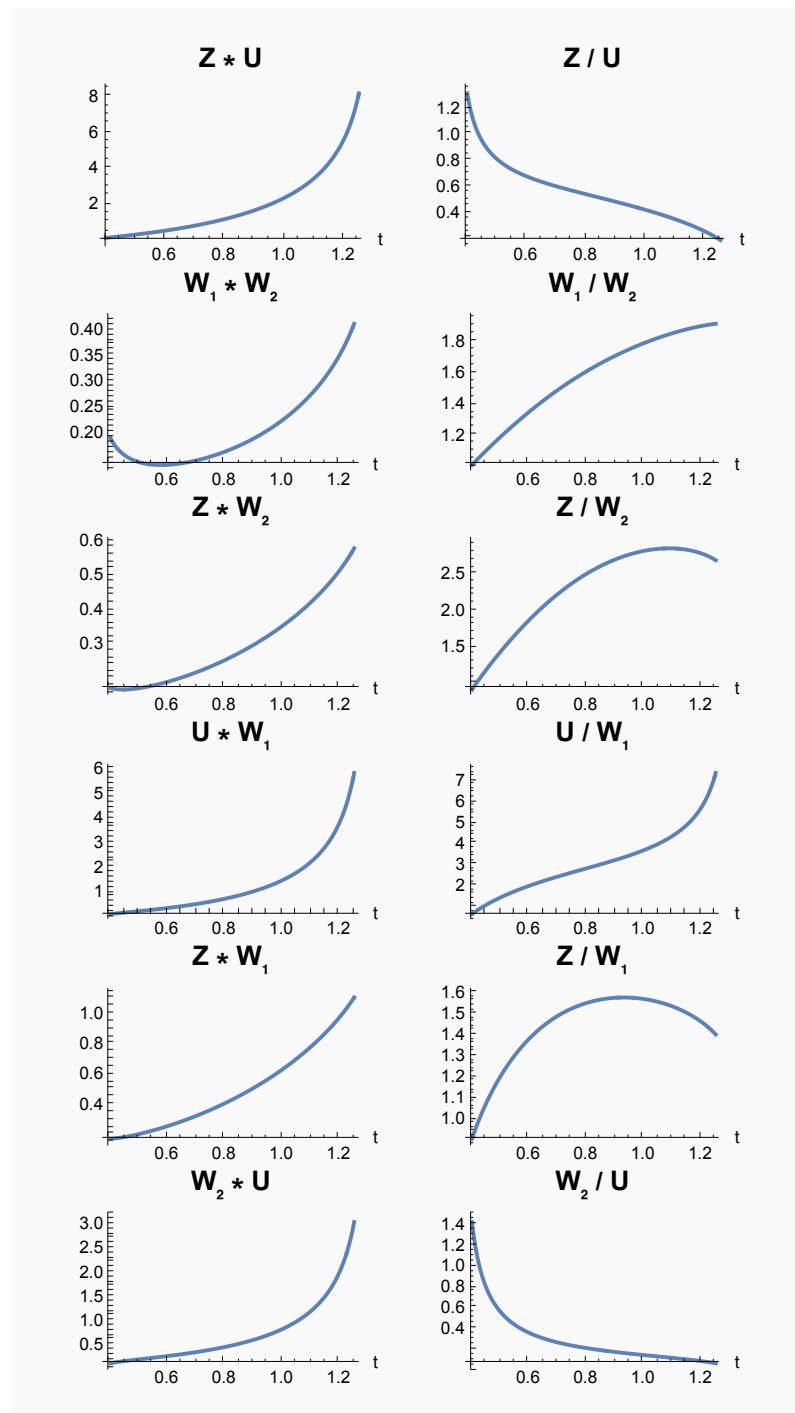

===== NOT LINEAR COMPOUND =====

Above we consider the first pair of equations ($P_1(t, W_1) = 0$ and $P_2(t, W_2) = 0$). Solving them as quadratic equations in W_1 and W_2 , respectively we parametrize the solutions by the first two and fourth expressions in Solutions 1 and 2 in a neighborhood of any point (W_1, t, W_2) such that the expression in the square root and denominators are not zero. Here, we choose any continuous branch of the square root in this neighborhood, and the signs in \pm need Not agree (this means we consider all 4 pairs we describe above). We conclude that NO component of the solution set of the first pair of Bricard's equations satisfies $W_1/W_2 = \text{const}$ NOR $W_1 W_2 = \text{const}$.

Analogously, NO component of the solution set of the other pair of equations ($P_3(U, W_2) = 0$ and $P_4(U, W_1) = 0$) satisfies $W_1/W_2 = \text{const}$ NOR $W_1 W_2 = \text{const}$. As a result, NO component of the solution set of all four equations satisfies $W_1/W_2 = \text{const}$ NOR $W_1 W_2 = \text{const}$. So, our example does not belong to the linear compound class, even after switching the boundary strips.

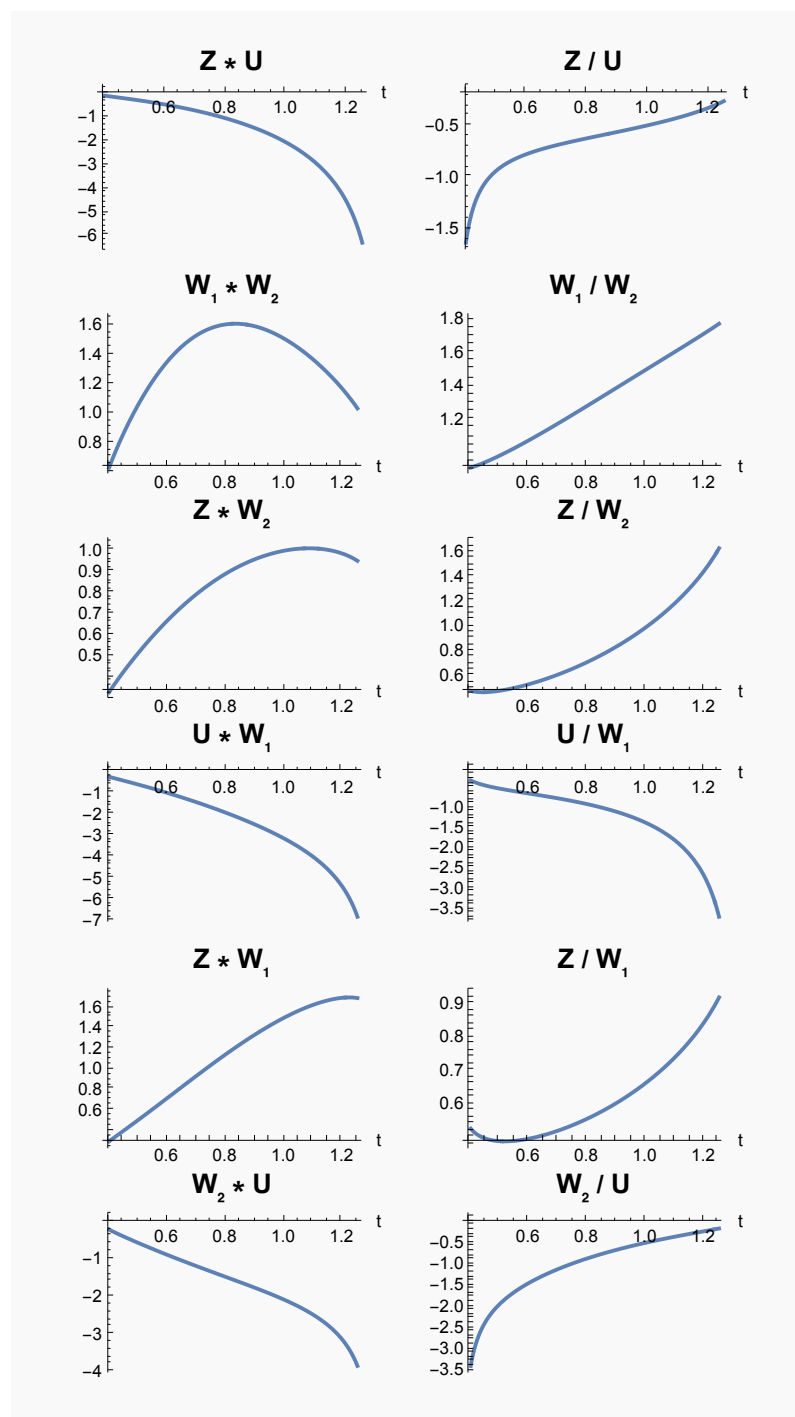

Below, we also present the plots of functions ZU , Z/U , W_1W_2 , W_1/W_2 , ZW_2 , Z/W_2 , UW_1 , U/W_1 , ZW_1 , Z/W_1 , W_2U , W_2/U .
